12.0 CONCLUSION

1.0 PROJECT OVERVIEW

Small and Medium Enterprises (SMEs) play a vital role in Nigeria's economy by creating jobs, driving innovation, and contributing significantly to economic growth. Every day, these businesses generate valuable data through sales transactions, customer purchases, inventory records, and financial activities. However, much of this data remains underutilized because many SME owners lack simple tools to transform it into meaningful business insights.

This project developed an AI-Powered SME Business Intelligence Dashboard to help business owners visualise sales performance, understand customer behaviour, monitor key business metrics, and support informed decision-making through interactive dashboards.

2.0 TARGET USERS

The dashboard is designed for:

- Small and Medium Enterprise (SME) owners
- Retail business owners
- Entrepreneurs
- Business managers
- Startups
- The solution enables these users to monitor business performance and make informed decisions without requiring advanced knowledge of data analytics.

3.0 PROBLEM STATEMENT

Many Small and Medium Enterprises (SMEs) generate valuable business data every day through sales transactions, customer records, and project management activities. However, this data is often stored without proper analysis, making it difficult for business owners to extract useful insights.

Most SME owners lack the technical skills, analytical tools, or time needed to interpret business data effectively. As a result, business decisions are frequently based on assumptions rather than evidence. This project addresses this challenge by providing a Business Intelligence Dashboard that transforms raw business data into clear visualisations that support better decision-making.

4.0 SOLUTION

The team developed an interactive Business Intelligence Dashboard using Microsoft Excel and Microsoft Power BI. The dashboard presents key business metrics through interactive visualisations, enabling users to monitor business performance and identify trends easily.

Key features include:

- Executive dashboard
- Total revenue
- Profit analysis
- Number of projects
- Product and service analysis
- Customer analysis
- Regional performance
- Interactive filters and slicers

The dashboard provides business owners with a simple and effective way to understand business performance and make data-driven decisions.

5.0 TECHNOLOGY STACK

Technology	Purpose
Microsoft Excel	Data cleaning and preparation
Microsoft Power BI & Gemini	Dashboard development and visualisation
ChatGPT	Synthetic dataset generation & documentation
Claude AI	Synthetic dataset generation & slide creation
Microsoft Teams	Team collaboration
GitHub	Project repository

6.0 AI COMPONENT

Artificial Intelligence (AI) was integrated into the project to enhance business intelligence by transforming dashboard outputs into meaningful business insights and actionable recommendations. The project leveraged AI to interpret analytical results, identify business trends, and provide strategic recommendations that support informed decision-making for SME owners.

Following the completion of data cleaning, exploratory data analysis, and dashboard development, AI was applied to analyse the dashboard outputs and generate an executive business report. The report highlighted key performance trends, identified operational challenges, and provided practical recommendations for improving business performance.

The AI component was used to:

- Generate executive summaries from dashboard findings.
- Interpret business performance indicators.

- Identify trends, risks, and growth opportunities.
- Provide practical recommendations for business improvement.
- Present analytical findings in clear and understandable language for business users.

By combining Business Intelligence with Artificial Intelligence, the solution enables SME owners to move beyond data visualisation by receiving intelligent, context-based insights that support strategic planning and operational decision-making.

7.0 DEVELOPMENT PROCESS

7.1 PROJECT IDEATION AND TOPIC SELECTION

The project began with a brainstorming session during which the team proposed ideas across the education, healthcare, and business sectors. Each idea was evaluated based on its relevance to real-world problems, feasibility, data availability, alignment with the Women Techsters Capstone Project objectives, and contribution to the United Nations Sustainable Development Goals (SDGs).

After careful evaluation, the team selected "AI-Powered SME Business Intelligence Dashboard: Simplifying Data Analytics for Better Business Decisions." The project was chosen because it addresses the challenges faced by Small and Medium Enterprises (SMEs) in making data-driven decisions and aligns closely with:

SDG 8: Decent Work and Economic Growth: supporting SMEs in improving productivity and business growth through data-driven decision-making.

SDG 9: Industry, Innovation and Infrastructure: by promoting the use of Business Intelligence and Artificial Intelligence to drive digital transformation and innovation in business operations.

Following the selection of the project topic, roles and responsibilities were assigned to team members, and the project execution phase commenced.

7.2 DATASET DEVELOPMENT

During the dataset development phase, the team evaluated different data sources to identify the most suitable dataset for the project. Public datasets from Kaggle were initially considered and reviewed. However, after careful assessment, the team observed that the available datasets lacked the business variables and field names required to achieve the project's objectives and support the planned business intelligence dashboard.

Following discussions among team members, the team generated a synthetic Interior Design SME dataset using ChatGPT and Claude AI. This approach enabled the creation of a customized dataset that contained all the necessary business variables, including customer information, product and service details, sales transactions, regional data, financial records, and other relevant fields required for data cleaning, analysis, and dashboard development.

The generated dataset was adopted as the official dataset for the project and served as the foundation for all subsequent phases.

7.3 DATA CLEANING AND PREPARATION

Following the generation of the Interior Design SME dataset, the Data Analysis Team conducted a comprehensive data cleaning exercise to improve the quality, consistency, and reliability of the data before analysis. The team first assessed the dataset to identify missing values, inconsistencies, duplicate records, and invalid entries that could affect the accuracy of the analysis.

During the initial assessment, the following issues were identified:

- Approximately 14 records contained unknown values in the State column.
- About 67 ongoing projects had completion dates recorded, creating inconsistencies.
- Three records had missing client names.
- Approximately 81 cancelled projects contained both start and completion dates, requiring validation before analysis.

These issues were resolved using appropriate data cleaning techniques. Missing and inconsistent records were reviewed, text fields were standardised, incorrect data types were corrected, duplicate records were removed where necessary, and the cleaned dataset was validated before proceeding to data analysis.

7.4 DATA ANALYSIS

After completing the data cleaning and preparation phase, the Data Analysis Team conducted an Exploratory Data Analysis (EDA) on the cleaned Interior Design SME dataset to identify business trends, measure performance, and generate insights for dashboard development.

The analysis focused on key business metrics and performance indicators that would support data-driven decision-making. These included:

- Total number of projects undertaken.
- Number of unique clients.
- Total revenue generated.
- Total profit earned.
- Average profit margin.
- Average customer satisfaction rating.
- Number of completed projects.
- Repeat client rate.
- Project status distribution (Completed, Delayed, Ongoing, and Cancelled).
- Revenue and profit performance across products, services, and regions.
- Customer and payment trends.

The findings from the exploratory analysis informed the design of the Power BI dashboard and guided the selection of the Key Performance Indicators (KPIs), charts, and interactive visualisations presented in the final solution.

7.5 DASHBOARD DEVELOPMENT

Following the completion of the exploratory data analysis, the Dashboard Development Team designed and developed an interactive Business Intelligence Dashboard using Microsoft Power BI.

The dashboard was developed to transform the analysed Interior Design SME dataset into an interactive reporting solution that enables users to monitor business performance and make informed decisions through data visualisation. The team designed multiple dashboard pages, each focusing on a specific aspect of the business, while incorporating interactive features to improve usability and user experience.

7.5.1 EXECUTIVE DASHBOARD

The Executive Dashboard provides a high-level overview of the business by displaying key performance indicators (KPIs) such as total projects, total revenue, total profit, unique clients, repeat client rate, average customer satisfaction, and project status. It serves as the primary dashboard for monitoring overall business performance.

7.5.2 PRODUCT AND SERVICE DASHBOARD

This dashboard focuses on the performance of products and services. It enables users to identify top-performing products and services, compare profitability, and analyse sales trends to support business planning and decision-making.

7.5.3 CUSTOMER AND REGIONAL DASHBOARD

The Customer and Regional Dashboard provides insights into customer behaviour and regional performance. It enables users to evaluate customer distribution, regional trends, and overall business performance across different locations.

7.5.4 INTERACTIVE FEATURES

To enhance usability, the dashboard incorporates interactive features such as KPI cards, charts, slicers, filters, and drill-down capabilities. These features allow users to interact with the data dynamically and obtain detailed insights based on their specific business needs.

8.0 AI INTEGRATION

Following the development of the Power BI dashboard, the AI Team integrated Artificial Intelligence into the solution by analysing the dashboard outputs and generating business intelligence insights and strategic recommendations.

Using AI tools, the team produced an executive summary of the company's performance, highlighting key financial indicators such as revenue, profit, profit margin, project performance, and operational risks. The AI-generated analysis further identified areas requiring management attention, including project cancellations, outstanding client balances, service performance, and customer satisfaction.

Based on these findings, the AI component generated strategic recommendations aimed at improving cash flow management, reducing project delays, enhancing marketing effectiveness, strengthening service delivery, improving customer satisfaction measurement, and supporting long-term business growth.

The integration of Artificial Intelligence complemented the Business Intelligence dashboard by translating complex analytical findings into practical business recommendations that can support informed decision-making for Small and Medium Enterprises (SMEs).

9.0 CHALLENGES ENCOUNTERED

Throughout the project, the team encountered several challenges that required collaboration and problem-solving. One of the initial challenges was identifying a suitable dataset that contained all the business variables required for the intended analysis and dashboard development. This was addressed by generating a synthetic Interior Design SME dataset using ChatGPT and Claude AI.

During the data preparation phase, the team encountered missing values, incomplete records, inconsistent data entries, and discrepancies between project statuses and completion dates. These issues required careful validation and field-specific cleaning techniques to preserve data integrity and ensure the reliability of the analysis.

The Dashboard Development Team also faced challenges in designing an interactive and user-friendly dashboard. Optimising the dashboard layout, implementing accurate DAX calculations, maintaining dashboard performance, and presenting business insights through effective visualisations required several iterations and collaborative reviews.

In addition, coordinating contributions from different functional teams within the limited project timeline required effective communication, continuous follow-up, and efficient task management to ensure the successful completion of the project.

10.0 LESSONS LEARNED

The project highlighted the importance of proper planning, teamwork, and effective communication in delivering a successful data analytics solution. It reinforced that the quality of business insights depends largely on the quality of the underlying data, making data cleaning and validation essential steps before analysis.

The team also gained practical experience in generating synthetic datasets using Artificial Intelligence, performing exploratory data analysis, developing interactive dashboards with Microsoft Power BI, and applying Business Intelligence techniques to solve real-world business problems.

Furthermore, the project demonstrated that well-designed dashboards should do more than display data; they should communicate meaningful insights that support informed decision-making. It also emphasised the value of integrating Artificial Intelligence into business intelligence workflows to improve efficiency, enhance decision-making, and support the digital transformation of Small and Medium Enterprises (SMEs).

The project demonstrated how Artificial Intelligence can complement Business Intelligence by converting analytical findings into practical recommendations. It also reinforced the importance of combining data analytics with AI to deliver solutions that are both informative and actionable for business users.

11.0 TEAM COLLABORATION

The success of this project was driven by effective collaboration among members of the different functional teams, including Project Management, Data Analysis, Dashboard Development, Artificial Intelligence, Documentation, Quality Assurance, and Presentation. Each team contributed its expertise while maintaining regular communication throughout the project lifecycle.

Collaboration was facilitated through Microsoft Teams, where meetings were held, progress updates were shared, responsibilities were coordinated, and decisions were made collectively. Draft outputs were also circulated among team members for review and validation before being incorporated into the final deliverables.

The project reinforced the principle that successful projects are built through collaboration rather than individual effort. By working together, sharing knowledge, and reviewing one another's contributions, the team was able to produce a more comprehensive, accurate, and high-quality solution.

The AI Team worked closely with the Dashboard Development Team to ensure that the generated insights accurately reflected the dashboard outputs. This collaboration ensured consistency between the visual analytics and the AI-generated business recommendations.

12.0 CONCLUSION

The AI-Powered SME Business Intelligence Dashboard successfully demonstrates how Business Intelligence and Artificial Intelligence can simplify business decision-making for SMEs. Through data generation, cleaning, analysis, and dashboard development, the project provides an accessible solution that transforms raw business data into actionable insights. Beyond the technical deliverables, the project strengthened the team's skills in collaboration, data analytics, project management, and problem-solving.

Inner Space Interior Design Company — Group 18 Capstone

BUSINESS INTELLIGENCE INSIGHTS & RECOMMENDATIONS

AI-Powered SME Business Intelligence Dashboard

Prepared for: Inner Space Interior Design Company | Group 18 Tek4dev 5.1 Capstone Project

Executive Summary

Inner Space Interior Design Company generated ₦2.48 billion in total revenue across 299 projects, converting to ₦716.85 million in net profit at a 28.95% margin — a strong result relative to typical Nigerian SME benchmarks of 15–20%. However, the dashboard exposes two structural risks sitting beneath these healthy headline numbers: a 27% project cancellation rate and ₦842.86 million tied up in unpaid client balances. Left unaddressed, both will quietly erode the margin advantage the business currently enjoys.

₦2.48bn TOTAL REVENUE	₦716.85M TOTAL PROFIT	28.95% PROFIT MARGIN	299 PROJECTS MANAGED
--------------------------	--------------------------	-------------------------	-------------------------

Key Business Insights

1. Profitable Core, Leaking Pipeline

The business converts revenue to profit efficiently — a 28.95% margin is well above the informal-sector norm. But profitability at the top-level masks funnel inefficiency: of 299 signed projects, only 137 (45.8%) reached completion.

Completed	Ongoing	Delayed	Cancelled
137 projects	6 projects	75 projects	81 projects
45.8% of total	2.0% of total	25.1% of total	27.1% of total

Combined, delayed and cancelled projects (52.2%) represent more than half of all signed work not converting cleanly to closed revenue. Cancellations alone (81 projects, 27.1%) constitute the single largest controllable leak in the business — revenue that was contracted but never realised.

2. Cash Is Trapped with Your Best Clients

Corporate clients are the most valuable segment by revenue (₦1.39 billion combined), but they also hold the largest outstanding balance in the business.

Client Type	Outstanding	Paid	Part Payment
Individual	₦353.17M	₦398.21M	₦332.93M
Corporate	₦489.69M	₦427.15M	₦475.02M
Total	₦842.86M	₦825.35M	₦807.96M

₦489.69 million of corporate revenue is unpaid, against ₦353.17 million for individual clients. Since corporate accounts are the largest revenue driver, this concentration of receivables creates a working-capital constraint: profit is being recognised on paper before cash is actually collected, which can restrict the company's ability to fund new projects.

Page 1 of 3

Inner Space Interior Design Company — Group 18 Capstone

3. Revenue Is Concentrated Outside the Core Brand Service

The company is positioned as an interior design specialist, yet Interior Design is the lowest-earning service category on the dashboard.

Service Category	Total Revenue	Share of Revenue Analysed
Painting	₦0.51bn	Highest earner
Decoration	₦0.43bn	2nd highest
Renovation	₦0.39bn	3rd highest
Interior Design	₦0.25bn	Lowest — flagship service underperforming

Painting, Decoration, and Renovation collectively outperform the company's namesake service. This is not necessarily a weakness — diversified revenue is healthy — but it does suggest either under-pricing, under-marketing, or under-resourcing of the flagship offering relative to demand for ancillary services.

4. Lead Volume Is Not Yet Linked to Lead Quality

Walk-in, Facebook, Website, Referral, and Instagram all generate meaningful project volume, but the dashboard does not currently cross-reference referral source against project outcome (completed vs. delayed vs. cancelled). This means marketing spend may currently be allocated by volume of leads generated rather than value of leads converted — a gap worth closing given that 81 cancellations are sitting somewhere in that channel mix.

DASHBOARD TEAM

Advanced Analysis Columns (For Customer & Market Tiers):

Right-click your main data table, click **New Column**, and apply these analytical groupings:

dax

```
Satisfaction Segment =  
SWITCH(  
    TRUE(),  
    'Projects'[Customer Satisfaction] > 4,  
    'Projects'[Customer Satisfaction] > 3,  
    'Projects'[Customer Satisfaction] > 2,  
    "Dissatisfied (<2.5)"  
)
```

dax

```
Project Value Tier =  
SWITCH(  
    TRUE(),  
    'Projects'[Revenue] >= 15000000, "High Value (>15M)",  
    'Projects'[Revenue] >= 5000000, "Mid Value (>5M)",  
    "Low Value (<5M)"  
)
```

Step 4: Visual-hv-Visual Design

+ Ask Gemini

To prevent broken time trends, do not use raw tracking dates directly. Go to the **Modeling** tab in Power BI Desktop, click **New Table**, and enter the following DAX formula:

dax

```
Dim_Calendar =  
ADDCOLUMNS (  
    CALENDAR ( DATE ( 2022, 01, 01 ), DATE ( 2022, 12, 31 ) ),  
    "Year", YEAR ( [Date] ),  
    "Month Number", MONTH ( [Date] ),  
    "Month Name", FORMAT ( [Date], "MMMM" ),  
    "Month Short", FORMAT ( [Date], "MMM" ),  
    "Quarter", "Q" & FORMAT ( [Date], "Q" ),  
    "Year Month Key", VALUE ( FORMAT ( [Date], "YYYYMM" ) ),  
    "Year Month Short", FORMAT ( [Date], "YYYYMM" )  
)
```

- **Crucial Fix:** Select the **Month Short** column, go to **Column Tools**, click **Sort by Column**, and select **Month Number**. This prevents months from sorting alphabetically (April, August, December...) instead of chronologically.

+ Ask Gemini
